

A close-up photograph of two human hands, palms up, holding capsules. The left hand holds a single red capsule, and the right hand holds a single green capsule. The background is dark and out of focus, showing some green foliage on the right side.

# OUTRO TO PS239T

# WHY ARE WE HERE?

# AIMS OF THE COURSE

- ▶ **Skills** (the grammar)
  - ▶ Bash, Python, R, Git
  - ▶ Transfers between many languages
  - ▶ Relies on shared logics and structures
  - ▶ Constrains what can and can't be done
  - ▶ Used to **make sense** of things: shaping, analyzing, plotting
- ▶ **Applications** (the vocabulary)
  - ▶ APIs, webscraping, packages in Python and R, etc.
  - ▶ Used to **observe** and **obtain** things—in our case, data

# WHAT WE DID

- ▶ ***Learn to learn***
- ▶ What we learned:
  - ▶ Navigate & operate effectively in a UNIX environment
  - ▶ Master basic Git and GitHub workflows
  - ▶ Write, execute, and debug Python code for data collection and manipulation, as well as other computing tasks
  - ▶ Write, execute, and debug R code for statistical analysis
  - ▶ Master the fundamentals of good data visualization in R
  - ▶ Find answers to things we won't cover in this class

# OBSTACLES TO LEARNING

- ▶ Unspoken/tacit knowledge among coders ("banana banana banana")
- ▶ Learning to think like a computer (1s and 0s not as easy as you think)
- ▶ Becoming impatient while learning basic concepts (most errors lie here)
- ▶ Low endurance (the diligent bird builds the worm)
- ▶ Infrequent practice (fluency doesn't come from weekends)
- ▶ Solo coding (teaching is learning)
- ▶ Copy-and-pasting instead of typing (ctrl+c is not your friend)
- ▶ Disorganized coding (would you write an essay without an outline?)
- ▶ Failing to comment code as you go (## what does this do?)
- ▶ Expecting to be Gandalf (10-20 lines a day)

# (NON-)OBSTACLES TO GROWING IN YOUR CODING

- ▶ **You didn't learn how to do everything (or even how to do everything you want to do)**
  - ▶ If you had, it would have been a complete waste of your time. Languages and tools change
- ▶ **You'll forget things**
  - ▶ So do I. (Let us not forget the many "arghhh" moments in my transition from Python 2 to Python 3)
  - ▶ Comments and docstrings are key
- ▶ **You're not totally self-sufficient**
  - ▶ 2.7 million questions/year on Stack Overflow suggest no one else is, either

# MOVING FORWARD

- ▶ Build off your final projects (reusable code is capital)
- ▶ Experiment now while things are freshest
- ▶ When things stop being fresh, go back to basics (remember swirl, codeacademy, D-Lab, etc.)
- ▶ Consider teaching

**“WHAT WOULD YOU DO IF YOU  
WEREN'T AFRAID?”**
